Venue: Room 513, Main Building

Abstract:

Nuclear Physics aims at understanding the fundamental properties of matter and the origin of the universe. The availability of short-lived nuclei produced at the radioactive-isotope beam (RIB) facilities worldwide in recent years has led to numerous discoveries of new phenomena in exotic nuclei, such as emergence of new magic numbers, neutron halos and skin. To understand these novel features, it is essential to obtain detailed knowledge of correlations between nucleons. In this talk, I will present HKU experimental programs at the world's leading RIB facilities including RIBF/RIKEN (Japan) and NSCL/MSU (United States) to investigate new magicity of exotic nuclei and nucleon correlations. I will also discuss about the detection array projects at HKU.
